Web3 Backend & Fullstack Engineer — Solana & EVM · TypeScript, Rust, Solidity

na3aga@gmail.com | Telegram @na3aga | github.com/Na3aga | linkedin.com/in/na3aga | Ukraine · Remote

SUMMARY

Backend and fullstack Web3 engineer with 6 years of experience, 5 of them in blockchain. I build multi-chain integrations and on-chain transaction pipelines across EVM chains (Ethereum, Polygon, Optimism, Avalanche) and non-EVM chains (Solana, TON, Tron, Stellar, Concordium). I write Solana programs in Rust and Anchor, EVM contracts in Solidity, and backend services in TypeScript (NestJS), Rust and Go. My code passed 6+ external audits (Pashov Audit Group, Zokkio and others) with no re-audit, including a lending protocol that processed \$10M+ in volume. I own products from architecture to production: CI/CD, cloud deployment (AWS, Railway, Render, Netlify), indexers, monitoring and keepers. As Smart Contract Competence Lead I review architecture, supervise audits and design service offerings for enterprise clients.

SKILLS

Languages Rust · Solidity · Go · TypeScript, JavaScript · Python · SQL, NoSQL	Solana Anchor and native Rust programs · Account model, PDAs, CPI · Compute budget and transaction limits · SPL tokens · web3.js, wallet integrations	EVM Ethers.js, viem, Wagmi · Hardhat, Foundry · The Graph · Multisig, Safe protocol · L2 deployments: Polygon, Optimism, Arbitrum, Base
Backend and frontend Node.js, NestJS · Rust and Go services · REST API design · Third-party API integrations · PostgreSQL, MongoDB, Redis · React, Next.js	Infrastructure Docker, CI/CD pipelines · AWS, Railway, Render, Netlify · Linux, shell scripting · On-chain indexing services · Monitoring and keepers	Domains DeFi: AMMs, CLMM, vaults, restaking · Lending and borrowing · Cross-chain bridges · Smart contract audits · ZK proofs: Groth16, Circom · DID

EXPERIENCE

Boosty Labs — Smart Contract Competence Lead

07.2024 – present

I lead end-to-end delivery of DeFi and cross-chain solutions across Solana, Ethereum, Avalanche, TON, Stellar, Tron, Concordium and Filecoin. I own architecture decisions, audit supervision and production deployment. I mentor backend, DevOps and frontend teams on blockchain integrations, and I designed several service offerings for outsourcing clients.

- Eliza Protocol — Orca CLMM position restaking, Solana · team of 4+
- Led development of a fullstack restaking dApp. Built the restaking program from scratch in Rust and Anchor for Orca concentrated-liquidity positions.
 - Passed the Zokkio security audit on the first attempt. No re-audit required.
 - Built the on-chain indexer, the TypeScript and Node.js backend, and the React frontend with wallet integrations. Deployed to production on Railway with CI/CD.

- Saffron — fullstack DeFi application, Solana and EVM · 6 months · team of 4+
- Built the Solana programs in Rust. They passed the Pashov Audit Group security audit.
 - Built the on-chain data indexing service and the transaction flows across Solana and EVM.
 - Delivered the TypeScript and Node.js backend and the React frontend with Solana and EVM wallet integrations. Owned CI/CD and deployment on Render and Netlify.

- Tricorn Bridge — cross-chain bridge · 6 months · team of 4+
- Smart Contract Tech Lead. Owned contract architecture and settlement flows across EVM chains, Solana, TON, Stellar, Tron and Concordium.
 - Built the complete Solana integration: on-chain programs, SPL token handling and settlement pipelines. Extended the bridge from EVM-only to non-EVM chains.
 - Supported the AWS infrastructure and deployment for the bridge services.

- Akave — on-chain data anchoring R&D, Ethereum and Avalanche · 1 year · team of 4+
- Tech Lead for R&D on large-scale data anchoring with a minimal on-chain footprint.
 - Built and benchmarked compression and storage strategies on Ethereum and Avalanche. Compared them on cost, throughput and data integrity.

- Somnia — protocol maintenance and audit remediation
- Diagnosed and fixed protocol bugs on a live system that secures millions of dollars.
 - Resolved external audit findings and delivered the fixes to production.

- Pre-sales and solution architecture
- Technical scoping, architecture proposals and feasibility assessments for prospective blockchain clients.

SoftServe — Blockchain Developer

02.2023 – 09.2024

- Safe-based multisig wallet with plugins, EVM
- Built a multisignature wallet with plugin modules on Safe protocol in Solidity. Tested with Hardhat and Foundry. Indexed with The Graph.
- L2 and multi-chain PoC projects for enterprise clients
- Delivered Web3 proofs of concept on Polygon, Avalanche, Optimism and Stellar. NestJS backends, Ethers.js and Wagmi frontends, Tenderly for simulation and debugging.
 - Trained client tech teams in Web3 practices.

- Decentralized identity and ZK evaluation
- Built PoC applications with Polygon ID, now Privado ID. Evaluated Dock.io, MATTR, Iden3 and Circom for capabilities and limits. Solidity, Circom, TypeScript.

JetSoftPro — Blockchain Developer, Solidity

02.2022 – 01.2023

- Bonq — liquidity protocol with stablecoin, EVM
- Built the lending protocol in Solidity: deposit and borrow, stablecoin tokenomics and liquidation logic.
 - The protocol processed \$10M+ in volume and passed an external security audit.
 - Built the indexing layer with The Graph and the NestJS backend. Integrated the React and Ethers.js frontend. Solidity, Hardhat, Mocha, The Graph, TypeScript, NestJS, Ethers.js, React.

VaultSwap — Solidity Engineer

02.2022 – 06.2022

- Exchange protocol for ERC-20, ERC-721 and ERC-1155
- Added features to an existing codebase and wrote the test suite from zero with Hardhat and Mocha. Integrated the React and Ethers.js frontend. Indexed with The Graph.

GetU.Finance — Blockchain dApp Developer, Solidity and React

04.2021 – 02.2022

Liquidity protocol, EVM

- Built the smart contracts with Hardhat and Truffle tests, and the React and Web3.js frontend. Built manual CI/CD on CentOS with Jenkins.

MAGETIC AI — Junior Python Developer

10.2020 – 05.2021

- Built the backend for a social network MVP: Flask REST APIs, Cassandra, Elasticsearch and Kibana, log processing, a small Apache Spark setup.
- First Web3 work: forked Pancake and Uniswap with basic functionality.

SELF PROJECT

BunnyBattle Solana — zero-knowledge board game with SOL betting · [open source](#)

- Anchor program in Rust: Groth16 proof verification, per-game treasury escrow on PDAs, timeout mechanics, protocol fees, admin controls. 17 of 17 tests pass, including tampered-proof and cross-player proof-reuse rejection.
- Circom circuits and a native prover path: rapidsnark via Bun FFI at about 10 ms per proof, snarkjs fallback.
- Rust indexer: Carbon crawler, axum API, Postgres, Redis. Chain-to-DB latency p50 2.2 s, p95 2.9 s.
- Vite and React web client with in-browser proving, and a React Native client for Solana Seeker. Deployed on Railway with CI/CD.

EDUCATION

National Technical University of Ukraine, Kyiv Polytechnic Institute

Master's degree, Mathematical Modelling and Data Science · 09.2018 – 06.2024
